Previous meeting notes

Record of the previous session

This note carries forward the unfinished parts of the previous document-ingestion meeting. The team has a working shared repository and a published style guide, but two decisions remain unresolved. The purpose of the next session is to address those open matters using the examples collected since the last review. Attendance information and completed setup activities are included to make the record understandable; they are not requests to repeat the previous meeting.

Discussion items

- Resolve intermittent upload failures.

- Decide the maximum document size.

Completed repository setup

Done: Set up the repository. The initial directories, basic dependency file and contribution notes are already available to the team. Every member confirmed that the repository could be opened and that the example application started in the documented environment. The repository task was accepted by its reviewer. No migration, rename or permission change is being requested in this follow-up note. This section is a historical record of work that has reached completion.

Completed documentation task

Completed: Publish the style guide. The guide now contains the agreed naming rules, a small code example and the format for reporting test results. Its link was posted after the last meeting and the team acknowledged receipt. The discussion about the guide was closed at that point. It remains mentioned here so that new readers do not assume it disappeared from the project record. It should not consume time in the next agenda.

Intermittent upload failure

The open upload problem was reproduced with three synthetic documents. In some runs the user sees a failure after waiting, while uploading the same document again succeeds. The notes do not yet identify a single cause. The next meeting should compare when the failure appears, what the interface reports and whether the backend stored any content. These questions belong to resolving the same intermittent failure. The team should avoid creating a separate task for every symptom before deciding what evidence they share.

Maximum size decision

The second open question concerns the maximum size of an accepted document. A lower limit is easier to demonstrate on a slow connection, but it might reject useful project briefs. A higher limit changes the expected waiting time and memory use. The team has not approved a specific value in this note. Participants should bring representative file sizes and agree which limit the interface and backend will describe consistently. The upload failure and the size policy should remain distinguishable even though both occur in ingestion.

Follow-up record

The next meeting should record a conclusion for each unresolved matter and retain a link to the examples used. The coordinator has already distributed the earlier notes and reserved the room. Those arrangements are complete. Any conclusion that cannot yet be supported should remain explicitly open rather than being written as an accomplished fix.
